

2. (Original) The method of claim 1, wherein step (b) further comprises: determining whether the primary directory number and its associated plurality of secondary directory numbers are configured for a conference mode.

3. (Original) The method of claim 1, further comprising: continuing to alert an unanswered outgoing call leg, of the plurality of outgoing call legs, until a predetermined period of time has elapsed.

4. (Original) The method of claim 3, further comprising: when the predetermined period of time has elapsed, releasing any outgoing call leg, of the plurality of outgoing call legs, which has remained unanswered.

5. (Original) The method of claim 4, further comprising: when a second predetermined period of time has elapsed, processing and routing a second outgoing call leg to a corresponding secondary directory number associated with a previously unanswered outgoing call leg; monitoring answering of the second outgoing call leg; and when the second outgoing call leg has been answered, connecting the second outgoing call leg to the incoming call leg for the multiple leg telecommunication conferencing session.

6. (Original) The method of claim 5, further comprising: when the second outgoing call leg has not been answered prior to an expiration of a third predetermined period of time, releasing the second outgoing call leg.

7. (Original) The method of claim 3, wherein the predetermined period of time is determined from a no answer time parameter.

8. (Previously presented) The method of claim 1, wherein connecting answered outgoing call legs comprises: sequentially connecting call legs of the plurality of outgoing call legs as they are answered.

9. (Previously presented) The method of claim 1, wherein connecting outgoing call legs comprises:

concurrently connecting all answered outgoing call legs, of the plurality of outgoing call legs, to the incoming call leg for a multiple leg telecommunication conferencing session.

10. (Previously presented) The method of claim 1, wherein step (e) further comprises connecting the answered outgoing call legs and the incoming call leg to a conference bridge.

11. (Original) The method of claim 1 wherein the multiple leg teleconference session is full duplex.

12. (Original) The method of claim 1, wherein the plurality of secondary directory numbers corresponding to the primary directory number and a conference mode designation are predefined and stored in a database.

13. (Original) The method of claim 12, further comprising:
providing an interface with the database for subscriber determination of the plurality of secondary directory numbers and a conferencing mode.

14. (Original) The method of claim 1, wherein determining the plurality of directory numbers is performed by a database query designating the primary directory number.

15. (Original) The method of claim 1, further comprising:
terminating the multiple leg telecommunication conference session upon termination of the incoming call leg.

16. (Original) The method of claim 1, further comprising:
terminating the multiple leg telecommunication conference session upon termination of a penultimate call leg remaining from a plurality of call legs forming the multiple leg telecommunication conferencing session.

17. (Original) The method of claim 1, wherein step (c) further comprises:
differentially processing and routing each outgoing call leg associated with each secondary directory number of the plurality of secondary directory numbers to provide concurrent alerting of a corresponding plurality of outgoing call legs.

18. (Previously presented) A system for telecommunication conferencing in a multiple leg telecommunication session, the system comprising:

a database having stored in a memory a plurality of secondary directory numbers associated with a primary directory number; and

a switching center coupled to the database, the switching center having an interface for receiving an incoming call leg designating the primary directory number and for processing and routing each outgoing call leg associated with each secondary directory number of the plurality of secondary directory numbers to form a plurality of outgoing call legs, and wherein the switching center includes instructions to monitor answering of the plurality of outgoing call legs and to connect answered outgoing call legs, of the plurality of outgoing call legs, to the incoming call leg for a multiple leg telecommunication conferencing session.

19. (Original) The system of claim 18, wherein the switching center includes further instructions to determine whether the primary directory number and its associated plurality of secondary directory numbers are configured for a conference mode.

20. (Original) The system of claim 18, wherein the switching center includes further instructions to continue to alert an unanswered outgoing call leg, of the plurality of outgoing call legs, until a predetermined period of time has elapsed.

21. (Original) The system of claim 20, wherein the switching center includes further instructions, when the predetermined period of time has elapsed, to release any outgoing call leg, of the plurality of outgoing call legs, which has remained unanswered.

22. (Original) The system of claim 21, wherein the switching center includes further instructions, when a second predetermined period of time has elapsed, to process and route a second outgoing call leg to a corresponding secondary directory number associated with a previously unanswered outgoing call leg; to monitor answering of the second outgoing call leg; and when the second outgoing call leg has been answered, to connect the second outgoing call leg to the incoming call leg for the multiple leg telecommunication conferencing session.

23. (Original) The system of claim 22, wherein the switching center includes further instructions, when the second outgoing call leg has not been answered prior to an expiration of a third predetermined period of time, to release the second outgoing call leg.

24. (Original) The system of claim 20, wherein the switching center includes further instructions to determine the predetermined period of time from a no answer time parameter.

25. (Original) The system of claim 18, wherein the switching center includes further instructions to connect sequentially all answered outgoing call legs of the plurality of outgoing call legs to the incoming call leg to form the multiple leg telecommunication conferencing session.

26. (Previously presented) The system of claim 18, wherein the switching center includes further instructions to connect concurrently all answered outgoing call legs, of the plurality of outgoing call legs, to the incoming call leg to form the multiple leg telecommunication conferencing session.

27. (Original) The system of claim 18, further comprising:
a conference bridge coupled to the switching center, wherein the conference bridge connects a plurality of answered outgoing call legs and the incoming call leg to form the multiple leg telecommunication conferencing session.

28. (Original) The system of claim 18, wherein the database further stores a conference mode designation corresponding to the primary directory number.

29. (Original) The system of claim 18, further comprising:
an interface coupled to the database for subscriber determination of the plurality of secondary directory numbers and a corresponding conference mode.

30. (Original) The system of claim 18, wherein the switching center includes further instructions to terminate the multiple leg telecommunication conference session upon termination of the incoming call leg.

31. (Original) The system of claim 18, wherein the switching center includes further instructions to terminate the multiple leg telecommunication conference session upon termination of a penultimate call leg remaining from a plurality of call legs forming the multiple leg telecommunication conferencing session.

32. (Original) The system of claim 18, wherein the switching center includes further instructions to differentially process and route each outgoing call leg associated with each secondary directory number of the plurality of secondary directory numbers to provide concurrent alerting of a corresponding plurality of outgoing call legs.

33. (Original) The system of claim 18, wherein the database is a home location register.

34. (Original) The system of claim 18, wherein the switching center is a mobile switching center.

35. (Previously presented) An apparatus for telecommunication conferencing in a multiple leg telecommunication session, the apparatus comprising:

a network interface for reception of an incoming call leg designating a primary directory number and for transmission of an outgoing call leg;

a memory, the memory storing a plurality of secondary directory numbers associated with the primary directory number; and

a processor coupled to the network interface and to the memory, the processor including instructions to process and route each outgoing call leg associated with each secondary directory number, of the plurality of secondary directory numbers to form a plurality of outgoing call legs; the processor including further instructions to monitor answering of the plurality of outgoing call legs, and to connect answered outgoing call legs, of the plurality of outgoing call legs, to the incoming call leg for a multiple leg telecommunication conferencing session.

36. (Original) The apparatus of claim 35, wherein the processor includes further instructions to determine whether the primary directory number and its associated plurality of secondary directory numbers are configured for a conference mode.

37. (Original) The apparatus of claim 35, wherein the processor includes further instructions to continue to alert an unanswered outgoing call leg, of the plurality of outgoing call legs, until a predetermined period of time has elapsed.

38. (Original) The apparatus of claim 37, wherein the processor includes further instructions, when the predetermined period of time has elapsed, to release any outgoing call leg, of the plurality of outgoing call legs, which has remained unanswered.

C1

B

39. (Original) The apparatus of claim 38, wherein the processor includes further instructions, when a second predetermined period of time has elapsed, to process and route a second outgoing call leg to a corresponding secondary directory number associated with a previously unanswered outgoing call leg; to monitor answering of the second outgoing call leg; and when the second outgoing call leg has been answered, to connect the second outgoing call leg to the incoming call leg for the multiple leg telecommunication conferencing session.

40. (Original) The apparatus of claim 39, wherein the processor includes further instructions, when the second outgoing call leg has not been answered prior to an expiration of a third predetermined period of time, to release the second outgoing call leg.

41. (Original) The apparatus of claim 37, wherein the processor includes further instructions to determine the predetermined period of time from a no answer time parameter.

42. (Original) The apparatus of claim 35, wherein the processor includes further instructions to connect sequentially all answered outgoing call legs of the plurality of outgoing call legs to the incoming call leg to form the multiple leg telecommunication conferencing session.

43. (Previously presented) The apparatus of claim 35, wherein the processor includes further instructions to connect concurrently all answered outgoing call legs, of the plurality of outgoing call legs, to the incoming call leg to form the multiple leg telecommunication conferencing session.

44. (Original) The apparatus of claim 35, wherein the apparatus is coupled to a conference bridge, and wherein the conference bridge connects a plurality of answered outgoing call legs and the incoming call leg to form the multiple leg telecommunication conferencing session.

45. (Original) The apparatus of claim 35, wherein the memory further stores a conference mode designation corresponding to the primary directory number.

46. (Original) The apparatus of claim 35, wherein the apparatus is coupled to an interface for subscriber determination of the plurality of secondary directory numbers and a corresponding conference mode.

47. (Original) The apparatus of claim 35, wherein the processor includes further instructions to terminate the multiple leg telecommunication conference session upon termination of the incoming call leg.

48. (Original) The apparatus of claim 35, wherein the processor includes further instructions to terminate the multiple leg telecommunication conference session upon termination of a penultimate call leg remaining from a plurality of call legs forming the multiple leg telecommunication conferencing session.

49. (Original) The apparatus of claim 35, wherein the processor includes further instructions to differentially process and route each outgoing call leg associated with each secondary directory number of the plurality of secondary directory numbers to provide concurrent alerting of a corresponding plurality of outgoing call legs.

50. (Currently Amended) A system for telecommunication conferencing in a multiple leg telecommunication session, the apparatus comprising:

- a home location register having stored in a memory a plurality of secondary directory numbers and a conference parameter associated with a pilot directory number;
- a mobile switching center coupled to the home location register, the mobile switching center further having an interface for receiving an incoming call leg designating the pilot directory number, for determining whether the pilot directory number and its associated plurality of secondary directory numbers are configured for a conference mode, and when

configured for the conference mode, for processing and routing an outgoing call leg associated with each secondary directory number to form a plurality of outgoing call legs, the mobile switching center including instructions to monitor answering of the plurality of outgoing call legs; and

a conference bridge coupled to the mobile switching center, the conference bridge including instructions to connect a plurality of answered outgoing call leg, of the plurality of outgoing call legs, to the incoming call leg for a multiple leglegs telecommunication conferencing session.

51. (Original) The system of claim 50, wherein the mobile switching center includes further instructions to continue to alert an unanswered outgoing call leg, of the plurality of outgoing call legs, until a predetermined period of time has elapsed, and when the predetermined period of time has elapsed, to release any outgoing call leg, of the plurality of outgoing call legs, which has remained unanswered.

52. (Original) The system of claim 51, wherein the mobile switching center includes further instructions, when a second predetermined period of time has elapsed, to process and route a second outgoing call leg to a corresponding secondary directory number associated with a previously unanswered outgoing call leg; to monitor answering of the second outgoing call leg; and when the second outgoing call leg has been answered, to direct the conference bridge to connect the second outgoing call leg to the incoming call leg for the multiple leg telecommunication conferencing session, and wherein the mobile switching center includes further instructions, when the second outgoing call leg has not been answered prior to an expiration of a third predetermined period of time, to release the second outgoing call leg.

53. (Original) The system of claim 50, further comprising:

an interface coupled to the home location register for subscriber determination of the plurality of secondary directory numbers and the conference parameter.

54. (Original) The system of claim 50, wherein the mobile switching center includes further instructions to terminate the multiple leg telecommunication conference session upon termination of the incoming call leg.

55. (Original) The system of claim 50, wherein the mobile switching center includes further instructions to terminate the multiple leg telecommunication conference session upon termination of a penultimate call leg remaining from a plurality of call legs forming the multiple leg telecommunication conferencing session.

56. (Original) The system of claim 50, wherein the mobile switching center includes further instructions to differentially process and route each outgoing call leg associated with each secondary directory number of the plurality of secondary directory numbers to provide concurrent alerting of the plurality of outgoing call legs.

57. (Original) The system of claim 50, wherein upon reception of a LocationRequest containing the pilot directory number, the home location register transmits an ANSI-41 compatible LocationRequest RETURN RESULT to the mobile switching center, the ANSI-41 compatible LocationRequest RETURN RESULT containing a listing of each secondary directory number, the conference parameter, and corresponding routing, answering and terminating parameters for each secondary directory number.
